

ASEAN NCAP PROTOCOL

2021
2025

TEST PROTOCOL – AEB SYSTEMS

Version 1.1
September 2020

Preface

Where text is contained within square brackets, this denotes that the procedure being discussed is currently being trialled in ASEAN NCAP. Its incorporation in the Test Protocol will be reviewed at a later date.

During the test preparation, vehicle manufacturers are encouraged to liaise with the laboratory and to check that they are satisfied with the way cars are set up for testing. Where a manufacturer feels that a particular item should be altered, they should ask the laboratory staff to make any necessary changes. Manufacturers are forbidden from making changes to any parameter that will influence the test, such as dummy positioning, vehicle setting, laboratory environment etc.

It is the responsibility of the test laboratory to ensure that any requested changes satisfy the requirements of ASEAN NCAP. Where a disagreement exists between the laboratory and manufacturer, the ASEAN NCAP secretariat should be informed immediately to pass final judgement. Where the laboratory staff suspect that a manufacturer has interfered with any of the setup, the manufacturer's representatives should be warned that they are not allowed to do so themselves. They should also be informed that if another incident occurs, they will be asked to leave the test site.

Where there is a recurrence of the problem, the manufacturer's representatives will be told to leave the test site and the Secretariat should be immediately informed.

Any such incident may be reported by the Secretariat to the manufacturer and the persons concerned may not be allowed to attend further ASEAN NCAP tests.

DISCLAIMER: ASEAN NCAP has taken all reasonable care to ensure that the information published in this protocol is accurate and reflects the technical decisions taken by the organisation. In the unlikely event that this protocol contains a typographical error or any other inaccuracy, ASEAN NCAP reserves the right to make corrections and determine the assessment and subsequent result of the affected requirement(s).

In addition to the settings specified in this protocol, the following information will be required from the manufacturer of the car being tested in order to facilitate the vehicle preparation. A vehicle handbook should be provided to the test laboratory prior to preparation.

TEST PROTOCOL – AEB SYSTEMS

NEW CAR ASSESSMENT PROGRAM FOR SOUTHEAST ASIAN COUNTRIES (ASEAN NCAP)

TEST PROTOCOL – AEB SYSTEMS

1 INTRODUCTION

Car-to-car rear impacts remain one of the most frequent road traffic accidents in Southeast Asia as a result of driver distraction or misjudgement.

Typical crashes during city driving normally occur at relatively low speeds where the impacted car is stationary, but with a high risk of a debilitating whiplash injury to the driver of the struck vehicle. While injury severities are usually low, these accidents are very frequent and represent over a quarter of all crashes.

Similar accident scenarios occur on the open road at moderate to higher speeds, where a driver might be distracted and may fail to recognize that the traffic in front of him has stopped, coming to a halt or is at a lower speed.

To support the driver in avoiding nose to tail crashes, car manufacturers offer avoidance technology that warns, supports adequate braking and/or ultimately stops the vehicle. The systems that work mostly at lower speed are referred to as AEB City systems whereas those that function at higher speed are called AEB Inter-Urban systems.

This protocol specifies the AEB City and AEB Inter-Urban test procedures which are part of the Safety Assist assessment, respectively. For AEB City, only the CCRs scenario is applicable where the AEB functionality at lower speed is tested.

For AEB Inter-Urban, the system is tested in one scenario (CCRm). For this type of AEB system, the AEB functionality is assessed.

2 DEFINITIONS

In this protocol, references are made to the following terms, namely:

Peak Braking Coefficient (PBC) – the measure of tyre to road surface friction based on the maximum deceleration of a rolling tyre, measured using the American Society for Testing and Materials (ASTM) E1136-10 (2010) standard reference test tyre, in accordance with ASTM Method E 1337-90 (reapproved 1996), at a speed of 64.4km/h, without water delivery.

Autonomous Emergency Braking (AEB) – braking that is applied automatically by the vehicle in response to the detection of a likely collision to reduce the vehicle speed and potentially avoid the collision.

Dynamic Brake Support (DBS) – a system that further amplifies the driver braking demand in response to the detection of a likely collision to achieve a greater deceleration than would otherwise be achieved for the braking demand in normal driving conditions.

Car-to-Car Rear Stationary (CCRs) – a collision in which a vehicle travels forwards towards another stationary vehicle and the frontal structure of the vehicle strikes the rear structure of the other.

Car-to-Car Rear Moving (CCRm) – a collision in which a vehicle travels forwards towards another vehicle that is travelling at constant speed and the frontal structure of the vehicle strikes the rear structure of the other.

Vehicle under test (VUT) – the vehicle tested according to this protocol with a pre-crash collision mitigation or avoidance system on board.

Vehicle width – the widest point of the vehicle ignoring the rear-view mirrors, side marker lamps, tyre pressure indicators, direction indicator lamps, position lamps, flexible mud-guards and the deflected part of the tyre side-walls immediately above the point of contact with the ground.

EURO Vehicle Target (EVT) – refers to the vehicle target used in this protocol.

Time To Collision (TTC) – the remaining time before the VUT strikes the EVT, assuming that the VUT and EVT would continue to travel with the speed it is travelling.

T_{AEB} – the time where the AEB system activates. Activation time is determined by identifying the last data point where the filtered acceleration signal is below -1

m/s^2 , and then returning to the point in time where the acceleration first crossed -0.3 m/s^2 .

T_{FCW} – the time where the audible warning of the FCW starts. The starting point is determined by audible recognition.

V_{impact} – the speed at which the VUT hits the EVT.

V_{rel_impact} – the relative speed at which the VUT hits the EVT by subtracting the velocity of the EVT from V_{impact} at the time of collision.

3 REFERENCE SYSTEM

3.1 Convention

3.1.1 For both VUT and EVT, ASEAN NCAP shall use the convention specified in ISO 8855:1991 in which the x-axis points toward the front of the vehicle, the y-axis toward the left and the z-axis upward (right hand system), with the origin at the most forward point on the centreline of the VUT for dynamic data measurements as shown in Figure 1.

3.1.2 Viewed from the origin, roll, pitch and yaw rotate clockwise around the x, y and z axes respectively. Longitudinal refers to the component of the measurement along the x-axis, lateral the component along the y-axis and vertical of the component along the z-axis.

3.1.3 This reference system should be used for both left-hand and right-hand drive vehicles tested.

Figure 1: Coordinate system and notation

3.2 Lateral Offset

3.2.1 The lateral offset is determined as the lateral distance between the centre of the front of the VUT and the centre of the rear of the EVT when measured in parallel to the intended straight lined path as shown in the figure below.

$$\text{Lateral offset} = Y_{\text{VUT error}} + Y_{\text{EVT error}}$$

Figure 2: Lateral offset

4 MEASURING EQUIPMENT

4.1 Sample and record

A sample and record of all dynamic data at a frequency of at least 100Hz are kept. They shall be synchronized using the DGPS time stamp the EVT data with that of the VUT.

4.2 Measurements and Variables

4.2.1 Time

- CCRs and CCRm: T_0 equals $TTC = 4s$

T

T₀

- T_{AEB} , time where AEB activates

T_{AEB}

- T_{FCW} , time where FCW activates

T_{FCW}

- T_{impact} , time where VUT impacts EVT

T_{impact}

4.2.2 Position of the VUT

during the entire test

X_{VUT}, Y_{VUT}

4.2.3 Position of the EVT

during the entire test

X_{EVT}, Y_{EVT}

4.2.4 Speed of the VUT

during the entire test

V_{VUT}

- V_{impact} , speed when VUT impacts EVT

V_{impact}

- V_{rel_impact} , relative speed when
VUT impacts EVT

V_{rel_impact}

4.2.5 Speed of the EVT

during the entire test

V_{EVT}

4.2.6 Yaw velocity of the VUT during the entire test

4.2.7 Yaw velocity of the EVT during the entire test

4.2.8 Acceleration of the VUT

during the entire test

A_{VUT}

4.2.9 Acceleration of the EVT

during the entire test

A_{EVT}

4.3 Measuring Equipment

4.3.1 Equip the VUT and EVT with data measurement and acquisition equipment to sample and record data with an accuracy of at least.

- VUT and EVT speed of 0.1km/h;
- VUT and EVT lateral and longitudinal position to 0.03m;
- VUT and EVT yaw rate to 0.1°/s;
- VUT and EVT longitudinal acceleration to 0.1m/s²;
- VUT steering wheel velocity to 1.0°/s.

4.4 Data Filtering

4.4.1 Filter the measured data as follows:

4.4.1.1 Position and speed are not filtered and are used in their raw state.

4.4.1.2 Acceleration with a 12-pole phaseless Butterworth filter with a cut off frequency of 10Hz.

4.4.1.3 Yaw rate with a 12-pole phaseless Butterworth filter with a cut off frequency of 10Hz.

4.4.1.4 Force with a 12-pole phaseless Butterworth filter with a cut off frequency of 10Hz.

5 EURO NCAP VEHICLE TARGET

5.1 Specification

5.1.1 Conduct the tests in this protocol using the EURO NCAP Vehicle Target V1 (EVT) as shown in Figure 3 below. The EVT replicates the visual, radar, LIDAR and PMD attributes of a typical M₁ passenger vehicle, and is impactable at differential speeds up to 50km/h without causing damage to the EVT.

Figure 3: Euro NCAP Vehicle Target (EVT)

5.1.2 To ensure repeatable results, the propulsion system and EVT must meet the requirements as detailed in ANNEX A.

5.1.3 The EVT is designed to work with the following types of sensors:

- Radar (24 and 77 GHz)
- LIDAR
- Camera
- PMD

Where a manufacturer believes that the EVT is suitable for another type of sensor system other than used by the VUT but is not listed above, the manufacturer is asked to contact the ASEAN NCAP Secretariat.

6 TEST CONDITIONS

6.1 Test Track

6.1.1 Conduct tests on a dry (no visible moisture on the surface), uniform, solid-paved surface with a consistent slope between level and 1%. The test surface shall have a minimal peak braking coefficient (PBC) of 0.9.

6.1.2 The surface must be paved and may not contain any irregularities (e.g. large dips or cracks, manhole covers or reflective studs) that may give rise to abnormal sensor measurements within a lateral distance of 3.0m to either side of the test path and with a longitudinal distance of 30m ahead of the VUT when the test ends.

6.1.3 The presence of lane markings is allowed. However, testing may only be conducted in an area where typical road markings depicting a driving lane may not be parallel to the test path within 3.0m either side. Lines or markings may cross the test path, but may not be present in the area where AEB activation is expected.

6.2 Weather Conditions

6.2.1 Conduct tests in dry conditions with ambient temperature above 5°C and below 40°C.

6.2.2 No precipitation shall be falling and horizontal visibility at ground level shall be greater than 1km. Wind speeds shall be below 10m/s to minimize EVT and VUT disturbance.

6.2.3 Natural ambient illumination must be homogenous in the test area and in excess of 2000 lux for daylight testing with no strong shadows cast across the test area other than those caused by the VUT or EVT. Ensure testing is not performed driving towards, or away from the sun when there is direct sunlight.

6.3 Surroundings

6.3.1 Conduct testing such that there are no other vehicles, highway furniture, obstructions, other objects or persons protruding above the test surface that may give rise to abnormal sensor measurements within a lateral distance of 3.0m to either side of the test path and within a longitudinal distance of 30m ahead of the VUT when the test ends (Figure 4).

6.3.2 Test areas where the VUT needs to pass under overhead signs, bridges, gantries or other significant structures are not permitted.

Figure 4: Free surroundings

6.3.3 The general view ahead and to either side of the test area shall comprise of a wholly plain man-made or natural environment (e.g. further test surface, plain coloured fencing or hoardings, natural vegetation or sky etc.) and must not comprise any highly reflective surfaces or contain any vehicle-like silhouettes that may give rise to abnormal sensor measurements.

6.4 VUT Preparation

6.4.1 AEB and FCW System Settings

6.4.1.1 Set any driver configurable elements of the AEB and/or FCW system (e.g. the timing of the collision warning or the braking application if present) to the middle setting or midpoint and the next latest setting similar to the examples shown in Figure 5.

Figure 5: AEB and/or FCW system setting for testing

6.4.2 Tyres

Perform the testing with new original fitment tyres of the make, model, size, speed and load rating as specified by the vehicle manufacturer. It is permitted to change the tyres which are supplied by the manufacturer or acquired at an official dealer representing the manufacturer if those tyres are identical in make, model, size, speed and load rating to the original fitment. Inflate the tyres to the vehicle manufacturer's recommended cold tyre inflation pressure(s). Use inflation pressures corresponding to least loading normal condition.

Run-in tyres according to the tyre conditioning procedure specified in 8.1.3. After running-in maintain the run-in tyres in the same position on the vehicle for the duration of the testing.

6.4.3 Wheel Alignment Measurement

The vehicle should be subject to a vehicle (in-line) geometry check to record the wheel alignment set by the OEM. This should be done with the vehicle in kerb weight.

6.4.4 Unladen Kerb Mass

6.4.4.1 Fill up the tank with fuel to at least 90% of the tank's capacity of fuel.

6.4.4.2 Check the oil level and top up to its maximum level if necessary. Similarly, top up the levels of all other fluids to their maximum levels if necessary.

6.4.4.3 Ensure that the vehicle has its spare wheel on board, if fitted, along with any tools supplied with the vehicle. Nothing else should be in the car.

6.4.4.4 Ensure that all tyres are inflated according to the manufacturer's instructions for the appropriate loading condition.

6.4.4.5 Measure the front and rear axle masses and determine the total mass of the vehicle. The total mass is the 'unladen kerb mass' of the vehicle. Record this mass in the test details.

6.4.4.6 Calculate the required ballast mass, by subtracting the mass of the test driver and test equipment from the required 200 kg interior load.

6.4.5 Vehicle Preparation

6.4.5.1 Fit the on-board test equipment and instrumentation in the vehicle. Also fit any associated cables, cabling boxes and power sources.

6.4.5.2 Place weights with a mass of the ballast mass. Any items added should be securely attached to the car.

6.4.5.3 With the driver in the vehicle, weigh the front and rear axle loads of the vehicle.

6.4.5.4 Compare these loads with the "unladen kerb mass"

6.4.5.5 The total vehicle mass shall be within $\pm 1\%$ of the sum of the unladen kerb mass, plus 200kg. The front/rear axle load distribution needs to be within 5% of the front/rear axle load distribution of the original unladen kerb mass plus full fuel load. If the vehicle differs from the requirements given in this paragraph, items may be removed or added to the vehicle which has no influence on its performance. Any items added to increase the vehicle mass should be securely attached to the car.

6.4.5.6 Repeat paragraphs 6.4.5.3 and 6.4.5.4 until the front and rear axle loads and the total vehicle mass are within the limits set in paragraph 6.4.5.5. Care needs to be taken when adding or removing weight in order to approximate the original vehicle inertial properties as close as possible. Record the final axle loads in the test details. Record the axle weights of the VUT in the 'as tested' condition.

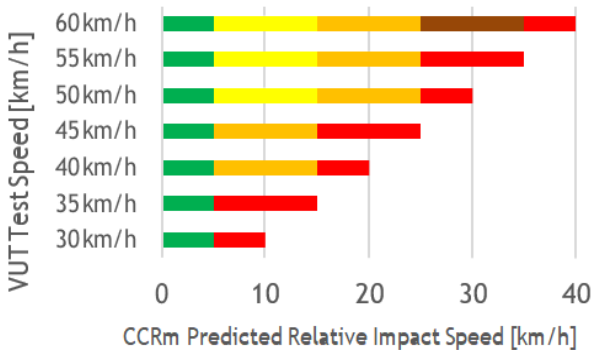

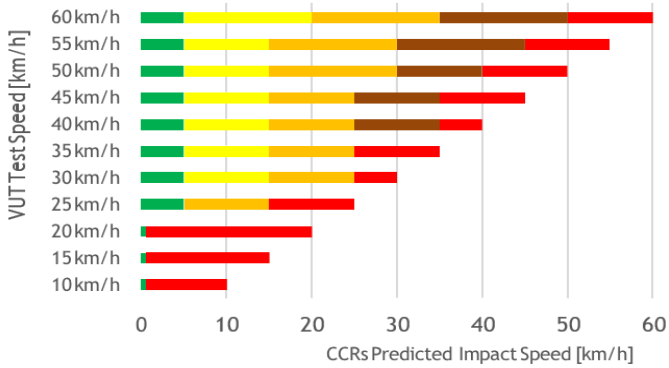

7 MANUFACTURER DATA

7.1 Manufacturer Supplied Data

7.1.1 The vehicle manufacturer is required to provide ASEAN NCAP Secretariat with the colour data (expected impact speeds are not required) detailing the performance of the vehicle in the CCRs and CCRm scenarios for all overlap and impact speed combinations. The prediction is to be done for both AEB and FCW system tests where applicable.

7.1.2 All data must be supplied by the manufacturer before any testing begins, preferably with delivery of the test vehicle(s).

7.1.3 Data shall be provided for each grid point according to the following colour scheme for AEB City (CCRs 10-60km/h) and for AEB Inter-Urban (CCRm 30-60km/h):

7.2 Absence of Manufacturer Data

7.2.1 Where predicted data is NOT provided by the vehicle manufacturer, ALL grid points are to be tested by ASEAN NCAP laboratory, considering symmetry.

7.2.2 For AEB systems tests, when there is complete avoidance, the subsequent test speed for the next test is increased by 10km/h. When there is contact, first perform a test at a test speed of 5km/h less than the test speed where contact occurred. After this, continue to perform the remainder of the tests with speed increments of 5km/h by repeating section 8.3.1 to 8.4.3. Stop testing when the speed reduction seen in the test is less than 5km/h.

8 TEST PROCEDURE

8.1 VUT Pre-test Conditioning

8.1.1 General

8.1.1.1 A car is used as delivered to the test laboratory.

8.1.1.2 If requested by the vehicle manufacturer, drive a maximum of 100km on a mixture of urban and rural roads with other traffic and roadside furniture to ‘calibrate’ the sensor system. Avoid harsh acceleration and braking.

8.1.2 Brakes

8.1.2.1 Condition the vehicle’s brakes in the following manner:

- Perform ten stops from a speed of 56km/h with an average deceleration of approximately 0.5 to 0.6g.
- Immediately following the series of 56km/h stops, perform three additional stops from a speed of 72km/h, each time applying sufficient force to the pedal to operate the vehicle's antilock braking system (ABS) for the majority of each stop.
- Immediately following the series of 72km/h stops, drive the vehicle at a speed of approximately 72km/h for five minutes to cool the brakes.
- Initiation of the first test shall begin within two hours after completion of the brake conditioning.

8.1.3 Tyres

8.1.3.1 Condition the vehicle's tyres in the following manner to remove the mould sheen:

- Drive around a circle of 30m in diameter at a speed sufficient to generate a lateral acceleration of approximately 0.5 to 0.6g for three clockwise laps followed by three anticlockwise laps.
- Immediately following the circular driving, drive four passes at 56km/h, performing ten cycles of a sinusoidal steering input in each pass at a frequency of 1Hz and amplitude sufficient to generate a peak lateral acceleration of approximately 0.5 to 0.6g.
- Make the steering wheel amplitude of the final cycle of the final pass double that of the previous inputs.

8.1.3.2 In case of instability in the sinusoidal driving, reduce the amplitude of the steering input to an appropriately safe level and continue the four passes.

8.1.4 AEB System Check

8.1.4.1 Before any testing begins, perform a maximum of ten runs at the lowest test speed the system is supposed to work, to ensure proper functioning of the system.

8.2 Test Scenarios

8.2.1 The performance of the VUT AEB system is assessed in the CCRs and CCRm scenarios as shown in Figures 6a and b.

8.2.2 For testing purposes, assume a straight-line path equivalent to the centreline of the lane in which the collision occurred, hereby known as the test path. Control the VUT with driver inputs or using alternative control systems that can modulate the vehicle controls as necessary to perform the tests.

Figure 6a: CCRs scenario

Figure 6b: CCRm scenario

8.2.3 The CCRs and CCRm tests will be performed with 5km/h or 10km/h incremental steps (see 8.4.4) within the speed ranges shown in the tables below.

CCRs	
	AEB ONLY
AEB City	10 - 60 km/h

CCRm	
	AEB ONLY
AEB Inter-Urban	30 - 60 km/h

8.2.4.1 The desired deceleration of the EVT shall be reached within 1.0 seconds and shall not vary by more than $\pm 0.25 \text{ m/s}^2$ of the desired level at any point in time until the end of test.

8.3 Test Conduct

8.3.1 Before every test run, drive the VUT around a circle of maximum diameter 30m at a speed less than 10km/h for one clockwise lap followed by one anticlockwise lap, and then maneuver the VUT into position on the test path. If requested by the OEM, an initialisation run may be included before every test run. Bring the VUT to a halt and push the brake pedal through the full extent of travel and release.

8.3.2 For vehicles with an automatic transmission, select D. For vehicles with a manual transmission, select the highest gear where the RPM will be at least 1500 at the test speed. If fitted, a speed limiting device or cruise control may be used to maintain the VUT speed unless the vehicle manufacturer shows that there are interferences of these devices with the AEB system in the VUT. Apply only minor steering inputs as necessary to maintain the VUT tracking along the test path.

8.3.3 Perform the first test a minimum of 90s and a maximum of 10 minutes after completing the tyre conditioning, and subsequent tests after the same time period. If the time between consecutive tests exceeds 10 minutes repeat the tyre conditioning procedures and recommence testing.

8.3.4 Between tests, maneuver the VUT at a maximum speed of 50km/h and avoid riding the brake pedal and harsh acceleration, braking or turning unless strictly necessary to maintain a safe testing environment.

8.4 Test Execution

8.4.1 Accelerate the VUT and EVT (if applicable) to the respective test speeds.

8.4.2 The test shall start at T_0 (4s TTC) and is valid when all boundary conditions are met between T_0 and T_{AEB}/T_{FCW} :

- Speed of VUT (GPS-speed)	Test speed + 1.0 km/h
- Speed of EVT (GPS-speed)	Test speed \pm 1.0 km/h
- Lateral deviation from test path	0 \pm 0.1 m
- Yaw velocity	0 \pm 1.0 $^{\circ}$ /s
- Steering wheel velocity	0 \pm 15.0 $^{\circ}$ /s

8.4.3 The end of a test is considered when one of the following occurs:

- $V_{VUT} = 0\text{km/h}$
- $V_{VUT} < V_{EVT}$
- Contact between VUT and EVT

8.4.4 For AEB systems tests, when there is complete avoidance, the subsequent test speed for the next test is increased by 10km/h. When there is contact, first perform a test at a test speed 5km/h less than the test speed where contact occurred. After this test continue to perform the remainder of the tests with speed increments of 5km/h by repeating section 8.3.1 to 8.4.3. Stop testing when the speed reduction seen in the test is less than 5km/h.

For manual or automatic accelerator control, it needs to be assured that during automatic brake the accelerator pedal does not result in an override of the system.

8.4.5 Braking will be applied that results in a maximum brake level of $-4 \text{ m/s}^2 - 0.25 \text{ m/s}^2$ when applied in a non-threat situation. The particular brake profile to be applied (pedal application rate applied in 200ms (max. 400mm/s) and pedal force) shall be specified by the manufacturer. When the brake profile provided by the manufacturer results in a higher brake level than allowed, the iteration steps as described in ANNEX B will be applied to scale the brake level to $-4 \text{ m/s}^2 - 0.25 \text{ m/s}^2$.

8.4.6 When no brake profile is provided, the default brake profile as described in ANNEX B will be applied.

ANNEX A

EVT SPECIFICATIONS

The Euro NCAP Vehicle Target (EVT) which is used for AEB City and Inter-Urban testing is developed to have the radar signature, reflectivity and visual signature comparable to that of a 'C' segment vehicle in order to aid radar, LIDAR, PMD and camera detection respectively.

The EVT is build up out of a balloon structure that is covered by a PVC cover on which a vehicle is printed. For both a detailed description is provided within this ANNEX.

A.1 Balloon Vehicle Structure

The balloon structure consists of polyester, polyethylene, PA 6.6, polychloroprene and nylon. The outer dimensions of the balloon structure are 1600 mm wide and 1350 mm tall with a tolerance of ± 10 mm. More detailed dimensions can be found in the front and side view in Figure A.1-1 and Figure A.1-2.

Figure A.1-2: Balloon structure side view

A.1.1 Radar Absorption Mat

At the impact side and rear of the balloon target a layer of radar absorbing material is applied. The exact position and dimensions of these radar absorption mats are shown in Figure A.1.1-1 and Figure A.1.1-2. The material properties of the radar absorption mat are detailed in paragraph A.1.1.1

Figure A.1.1-1: Rear and side view of balloon structure including the rear radar absorption mat

Figure A.1.1-2: Section B-B and side view of balloon structure including the front radar absorption mat

A.1.1.1 Material Properties

The radar absorption mats are according to ASTM-D 1692-68 and are made of Polyurethane foam EC 712 with the attenuation in dB as shown in the table below. The absorber can be loaded with 2 mW per mm².

Footprint	Thickness	<1GHz	3 GHz	5 GHz	10 GHz	18 GHz
500x500mm	10mm	---	10	25	35	40

A.1.2 Bumper

At the impact side, a bumper plate is attached to front of the balloon structure to create a more vehicle like contour. The dimensions and position of the bumper element are shown in Figure A.1.2-1 and Figure A.1.2-2. The tolerances on the dimensions are ± 10 mm.

Figure A.1.2-1: Side view of balloon structure including the bumper element

Figure A.1.2-2: Top, side, front and ISO view of bumper element

A.1.3 Radar Reflector

Within the bumper element, a radar reflector is incorporated. The reflector has an inside edge length of 55mm and imitates a surface of 2.5m² at 77GHz. The position and orientation of the radar reflector within the bumper element is shown in Figure A.1.3-1.

Figure A.1.3-1: Front and side view of the radar reflector within the bumper element

A.1.4 Reflective Film

In addition to the radar reflector, two reflective films of 1360mm wide and 150mm high are glued onto the bumper element as shown in Figure A.1.4-1. The films are made of polyester and are provided by Bruin Plastic Company INC (<http://www.bruinplastics.com/index.html>) under the product name of Energy Shield 200 - 10 oz. If another

reflection film is used, the reflection characteristics have to be identical as for the Energy Shield 200.

Figure A.1.4-1: Front view of the reflective film on the bumper element

A.2 EVT Outer Cover

The balloon structure is covered by a PVC cover with a picture of an actual car is printed. The cover material is produced by Complot Papier Union (<http://www.complotpapierunion.de/>) with the product name PowerJet Poly Banner Frontlit 550 B1, which is a 550 g/m² tarpaulin.

The generic artwork that needs to be printed onto the EVT cover can be provided by ASEAN NCAP. The artwork should be printed full colour to at least (100dpi) to give the correct contrast in colours of the vehicle rear.

A.2.1 Retro- Reflective Film

Retro-Reflective film is attached to the cover to replicate the reflectivity of the rear lights as shown in Figure A.2.1-1. The retro-reflective tape for the lights is produced according to the norm ECE 104. The top rear light retro-reflection film has to be in the upper middle of the car. The left and right have to be stuck congruent to the normal back lights and have to look like the original one.

Figure A.2.1-1: Front view of the EVT with the location of the retro-reflective tape

A.2.2 Radar Absorption Mat

At the impact side of the EVT a layer of radar absorbing material is applied to the bottom of the target to replicate the shadow between the wheels. The material of the absorption mat is the same as specified in A.1.1. The

dimensions of the mat are shown in Figure A.2.2-1 with a thickness of 20mm. The absorption mat is sewn into the EVT outer cover and is behind three layers of leather which were stuck together.

Figure A.2.2-1: Left, Front view of the EVT with the location of the lower radar absorption mat.
Right, different layers of absorption mat

A.3 EVT Test Position

The ground clearance of the balloon structure for testing is set to 70mm as shown in Figure A.3-1.

Figure A.3-1: Front view of the EVT showing the ground clearance

ANNEX B

BRAKE APPLICATION PROCEDURE

The braking input characterisation test determines the brake pedal displacement and force necessary to achieve a vehicle deceleration typical of that produced by a typical real-world driver in emergency situations.

B.1 Definitions

T_{BRAKE} - The point in time where the brake pedal displacement exceeds 5mm.

T_{-6m/s²} - The point in time is defined as the first data point where filtered, zeroed and corrected longitudinal acceleration data is less than -6m/s^2 .

T_{-2m/s²}, T_{-4m/s²} - similar to T_{-6m/s²}.

B.2 Measurements

Measurements and filters to be applied as described in Chapter 4 of this protocol.

B.3 Brake Characterization Procedure

First perform the brake and tyre conditioning tests as described in 7.1.2 and 7.1.3. The brake input characterisation tests shall be undertaken within 10 minutes after conditioning the brakes and tyres.

B.3.1 Brake Displacement Characterisation Tests

- Push the brake pedal through the full extent of travel and release.

- Accelerate the VUT to a speed in excess of 85km/h. Vehicles with an automatic transmission will be driven in D. For vehicles with a manual transmission select the highest gear where the RPM will be at least 1500 at the 85km/h.
- Release the accelerator and allow the vehicle to coast. At a speed of 80 ± 1.0 km/h initiate a ramp braking input with a pedal application rate of 20 ± 5 mm/s and apply the brake until a longitudinal acceleration of -7m/s^2 is achieved. For manual transmission vehicles, press the clutch as soon as the RPM drops below 1500. The test ends when a longitudinal acceleration of -7m/s^2 is achieved.
- Measure the pedal displacement and applied force normal to the direction of travel of the initial stroke of the brake pedal, or as close as possible to normal as can be repeatedly achieved.
- Perform three consecutive test runs. A minimum time of 90 seconds and a maximum time of 10 minutes shall be allowed between consecutive tests. If the maximum time of 10 minutes is exceeded, the tyre and brake conditioning procedures shall be repeated before restarting the brake pedal force characterisation tests.
- Using second order curve fit and the least squares method between $T_{-2\text{m/s}^2}$, $T_{-6\text{m/s}^2}$, calculate the pedal travel value corresponding to a longitudinal acceleration of -4m/s^2 (=D4, unit is m). Use data of at least three valid test runs for the curve fitting.
- This brake pedal displacement is referred to as D4 in the next chapters.

- Using second order curve fit and the least squares method between T_{-2m/s^2} , T_{-6m/s^2} , calculate the pedal force value corresponding to a longitudinal acceleration of $-4 m/s^2$ ($=F_4$, unit is N). Use data of at least three valid test runs for the curve fitting.
- This brake pedal force is referred to as F_4 in the next chapters.

B.3.3 Brake Force Confirmation and Iteration Procedure

- Accelerate the VUT to a speed of 80+1km/h. Vehicles with an automatic transmission will be driven in D. For vehicles with a manual transmission select the highest gear where the RPM will be at least 1500 at the 80km/h.
- Apply the brake force profile as specified in B.4, triggering the input manually rather than in response to the FCW. Determine the mean acceleration achieved during the window from $T_{BRAKE} +1s$ $T_{BRAKE} +3s$. If a mean acceleration outside the range of $-4-0.25m/s^2$ results, apply the following method to ratio the pedal force applied.
 $F_{4new} = F_{4original} * (-4/mean\ acceleration)$, i.e. if $F_{4original}$ results in a mean acceleration of $-5m/s^2$, $F_{4new} = F_{4original} * -4 / -5$
- Repeat the brake force profile with this newly calculated F_4 , determine the mean acceleration achieved and repeat the method as necessary until a mean acceleration within the range of $-4-0.25m/s^2$ is achieved.
- Three valid pedal force characteristic tests (with the acceleration level being in the range as specified) are required. A minimum time of 90 seconds and a maximum time of 10 minutes shall be allowed between consecutive

tests. If the maximum time of 10 minutes is exceeded, the tyre and brake conditioning procedures shall be repeated before restarting the brake pedal force characterisation tests. This brake pedal force is referred as F4 in the next chapters.

B.4 Brake Application Profile

- Detect T_{FCW} during the experiment in real-time.
- Release the accelerator at $T_{FCW} + 1$ s.
- Perform displacement control for the brake pedal, starting at $T_{FCW} + 1.2$ s with a gradient of the lesser of $5 \times D4$ or 400mm/s (meaning the gradient to reach pedal position D4 within 200ms, but capped to a maximum application rate of 400mm/s).
- Monitor brake force during displacement control and use second-order filtering with a cutoff frequency between 20 and 100 Hz (online) as appropriate.
- Switch to force control with a desired value of F4 when:
 - i. the value D4 as defined in B.3 is exceeded for the first time,
 - ii. the force F4 as defined in B.3 is exceeded for the first time, whichever is reached first.
- The point in time where position control is switched to force control is noted as T_{switch} .
- Maintain the force within boundaries of $F4 \pm 25\% F4$. A stable force level should be achieved within a period of 200ms maximum after the start of force control. Additional disturbances of the force over $\pm 25\% F4$ due to further AEB interventions are allowed, as long as they have a duration of less than 200ms.

- The average value of the force between $T_{FCW} + 1.4s$ and the end of the test should be in the range of $F4 \pm 10$ N.
